inch does not display properly what to do pablo__: looks like your graphics card isn't correctly identified. you could use this tool to fix it. !nv | pablo__ pablo__: For Ati/NVidia/Matrox video cards, see !amd Open driver for AMD cards: amdgpu (cards >= GCN1.2 aka GCN 3rd gen), radeon (older cards). Closed drivers: amdgpu-pro (>= GCN1.2) fglrx (older cards, unsupported by AMD in 16.04+). For info on GCN levels, see For fglrx info, see the info it's probably missing the drive letters, try 'lsblk' to get them pablo__: that means you need to install the amdgpu drivers, and possibly also mesa. ok pablo__: try sudo apt-get install --reinstall linux-image-generic does the package 'docker' have a clean dependency problem because of the snap? in xenial, or was that a docker.io thing? toward: the package names match, i think. tomreyn: mmmmm it's a kernel issue i think so sudo apt-get install --reinstall linux-image-generic is not working pablo__:'sudo apt-get install --reinstall linux-image-generic' pablo__: just fyi, unless you installed the nvidia proprietary drivers via ubuntu's default graphics driver mechanism, they will not be used here. 82157476af
